Category Name Design-CSS

Actionee HAIS

Sub Category

Subject Unclear specification of group mailboxes

Description of Problem or Suggestion:

C-CSS-61400 states that the Mail Service shall allow *destinations* including a position managed by several operators. Does this mean that it will provide the ability for several DAAC operators to manage a single mailbox as a group, or just that we can send mail to other addresses that happen to be mailboxes managed by a group?

Originator's Recommendation

If this means several DAAC operators can manage a mailbox as a group, simply clarify. If this function is not implied by this requirement, then it should be added to the requirements.

HAIS Response Date 8/10/95

The position destination is like a pseudo mailbox. All messages received at that mailbox are auto forwarded to the mailbox(es) of the user(s) who are responsible for performing the duties for that position. This means that the pseudo mailbox for the position acts like a deflector which forwards all incoming messages to a set of user mailboxes. It does not provide for a single mailbox which is managed by several operators, this is not a standard feature of E-mail packages we have reviewed. The E-mail can be configured to automatically forward any/all responses to all recipients of the original message to eliminate duplication of effort in responding to the messages.
